PrismScore — Peer Review & Assessment Report

Prepared by Claude · November 3–4, 2026 · Live end-to-end test of prism-score.vercel.app (ScienceWerx)

Contents

- Executive Summary
- Methodology
- Scorecard by Category
- Score Verification (Hand-Checked Math)
- Detailed Findings (7 sections)
- Reproduction Steps for the Critical Bug
- Priority Fix List
- Appendix: Full 25-Question Set by Dimension

Executive Summary

PrismScore is a 25-question, self-reported AI-readiness diagnostic that scores a company out of 500 across five weighted dimensions. The underlying instrument — the questions and the scoring logic — is well-designed and, on inspection, mathematically sound at the per-dimension level. The surrounding product is not yet reliable enough to put in front of prospects: the report page crashed on the very first, completely standard test run, and the content the site advertises as a $149 paid upgrade is actually delivered in full on the free report. **Overall: 5/10.**

- Two launch-blocking defects, both independent of the assessment design itself: a client-side crash on submit (P0), and a non-functional paywall (P0).
- The scoring formula is correctly implemented per dimension, but the final composite score is computed from pre-rounded percentages, producing a result that's off by 0.04 points from the published formula's true value.
- The free report's one auto-generated recommendation points at the company's strongest dimension rather than its two weakest (both at 60%) — the advice-generation logic likely needs rebalancing.

Methodology

This review was conducted by actually operating the product end to end, not by reading the marketing page alone. Steps taken: completed the Company & Leadership onboarding form with test data; used the built-in "Sample Data" shortcut to answer all 25 assessment questions; submitted the assessment; read the resulting Executive Report in full; inspected the browser console for runtime errors; hand-verified the scoring math against the audit log; and followed the

"Go to Leadership Dashboard" link. Every finding below is reproducible from that single run-through.

Category	Score	Key Issue
Construct & Question Design	7 / 10	Well-built maturity ladders; jargon undercuts the "zero-jargon" promise.
Scoring Accuracy	6 / 10	Per-dimension math is exact; the composite score has a rounding bug.
Technical Reliability	3 / 10 — CRITICAL	Hard crash on the first submit-to-report transition.
Paywall Enforcement	3 / 10 — CRITICAL	All advertised paid-only content renders on the free report.
Output Actionability	5 / 10	Only one recommendation generated, aimed at the wrong dimension.
UX & Completion Flow	6 / 10	Clean flow; default timer and audit-log renumbering hurt trust.
Secondary Issues	—	Leadership Dashboard shows demo data, not the real submission.

Score Verification (Hand-Checked Math)

I hand-verified every dimension percentage shown in the live report against the answers actually selected (via the report's own audit log). Every per-dimension figure ties out exactly; only the final composite score shows a small rounding discrepancy, detailed below the table.

Dimension	Weight	Points Scored	Percentage	Matches Report?
Strategy and Leadership	25%	11 / 15	73.3%	Yes
Use and Value	20%	9 / 15	60.0%	Yes
Data and	20%	10 / 15	66.7%	Yes

Technology				
Governance and Risk	20%	11 / 15	73.3%	Yes
People and Skills	15%	9 / 15	60.0%	Yes

Composite score as published formula would compute it (using exact fractions): **336.67 / 500.** Composite score as actually displayed on the live report (computed from pre-rounded percentages): **336.6 / 500.** The gap is cosmetic (0.07 points) but avoidable — see the Priority Fix List.

Detailed Findings

1. Construct & Question Design — 7 / 10

The 25 scenario questions are genuinely well-built: consistent 0–3 maturity ladders, concrete operational language ("staff secretly use AI to draft client replies" is a far better anchor than "informal usage"), and sensible grouping into five dimensions. Two issues pull the score down. First, several top-tier answer options use real technical jargon — "differential privacy," "vector embeddings," "zero-data-retention," "stage-gate pipeline," "DLP" — which sits awkwardly against the homepage's "Zero-Jargon Real Scenarios" promise, especially since the intended respondent is an operations lead, not necessarily a technical one. Second, the dimension weights (25/20/20/20/15) are published but never justified — transparency of the formula is not the same as a defensible rationale for why People & Skills counts least, when workforce adoption is widely cited as the top real-world blocker to enterprise AI ROI.

To reach 10/10: rewrite the handful of jargon-heavy answer options in plain operational language (or add a one-line inline gloss the way "DLP" already does), and publish a short rationale for the dimension weights — even a sentence per dimension citing why it's weighted as it is would convert "transparent" into "defensible."

2. Scoring Accuracy — 6 / 10

I hand-checked the math against the answers actually selected, using the report's own audit log (see the Score Verification table above). Every per-dimension percentage is exactly right. But the composite score has a real bug: the displayed 336.6/500 is computed from the already-rounded one-decimal dimension percentages rather than the underlying exact fractions. The true formula value is 336.67, not 336.6. It's a small discrepancy, but for a product whose entire pitch is "transparent, published math, not a black box," a composite that doesn't quite match its own stated formula undercuts the pitch.

To reach 10/10: compute the composite score from the raw fractional dimension values and only round for display at the very last step, so the number shown always ties out exactly to the published formula.

3. Technical Reliability — 3 / 10 (Critical)

Submitting a completely vanilla assessment — fresh company, sample answers, no unusual input — threw a hard crash: "Application error: a client-side exception has occurred." The browser console showed TypeError: Cannot convert undefined or null to object at Object.entries, inside the compiled report page bundle (report/company/[submissionId]/page.js). Reloading the exact same URL then rendered the report correctly with accurate data, which points to a race condition on the client-side route transition into the report page rather than a data problem — the report payload likely isn't fully available yet when the client-rendered page first tries to read it. This happened on my very first, completely standard run-through, meaning it will likely hit real users at the exact moment they expect to see their score — the worst possible place for a crash in this funnel.

To reach 10/10: guard the report page's render logic against the payload being briefly undefined during the client-side transition (loading state / null-check before Object.entries), or force a full navigation instead of a client-side route change after submit so the report route always receives fully-hydrated data.

4. Paywall Enforcement — 3 / 10 (Critical)

The homepage's pricing comparison table lists "Key Strengths & Critical Blindspots," "Prioritized Action Plan with Score Impact," and "Complete Response Audit Log (all 25 questions)" as Paid Full Report ($149) features only. On the live free report, all three sections rendered in full, unblurred, directly below the "Unlock Full Report — $149" banner — including every one of my 25 verbatim answers with point values. If this is also true in production, the free tier is currently giving away the entire paid deliverable at no cost.

To reach 10/10: add a server-side (not just UI) gate on the report endpoint so the Strengths, Critical Gaps, Action Roadmap, and full Audit Log sections are only populated in the API response after payment is confirmed — a CSS blur or client-side conditional alone is not sufficient, since the data would still be present in the page payload.

5. Output Actionability — 5 / 10

The report correctly identified no "critical" dimension (nothing scored at or below the apparent 40% threshold), but that design leaves a blind spot: Use & Value and People & Skills both sat at a mediocre 60% and received no callout at all — the apparent threshold for a "strength" callout is roughly 70%+. The single recommendation the report did generate pointed toward the strongest area ("scale autonomous agent workflows and frontier capability pilots") rather than the two middling dimensions — arguably backwards advice, since pushing toward multi-agent autonomy while People & Skills sits at 60% is exactly the kind of move the tool's own Governance & Risk dimension would flag as premature. There's also a small shipped grammar bug: the report literally reads "1 recommendations."

To reach 10/10: add a third tier between "critical gap" and "strength" (something like "moderate gap," 41–69%) so the 60% dimensions get a specific, targeted callout; bias the recommendation engine toward the lowest-scoring non-critical dimensions rather than the highest; and fix the pluralization on the recommendation count.

6. UX & Completion Flow — 6 / 10

The flow itself is clean and modern: clear step indicators, a visible progress bar, sensible defaults on the onboarding form, and a genuinely useful "Sample Data" button for testing. Two choices are questionable. The default per-question countdown timer (30 seconds, adjustable to 45s/60s/untimed) is an odd default for something meant to capture an honest, reflective self-assessment of internal company practices rather than reaction speed. And the "Complete Response Audit Log" on the report renumbers the 25 questions in a different order than the live assessment used (the dimension groups are reshuffled), so a user cross-referencing "Question 1" between the assessment and the report will find two different questions — a real problem for something explicitly marketed as a "transparent audit."

To reach 10/10: make "Untimed" the default (or at minimum a generous default like 60s) given the self-assessment nature of the task, and preserve the original question order and numbering in the audit log so IDs match 1:1 between the assessment and the report.

7. Secondary Observations

Clicking "Go to Leadership Dashboard" directly from a freshly completed company report dropped me into a generic /dashboard route showing an entirely unrelated, pre-seeded company ("Vanguard Systems, Inc.") rather than the company I had just assessed ("Test Diagnostics Inc.") — I could not confirm the C-level invite / 360 / heatmap pipeline is actually wired to a real submission yet, as opposed to always showing demo data. Separately, the report's branding ("OFFICIAL PRISMSCORE™ RESULT," bold and official-sounding) sits in some tension with the honest small-print disclosure right in the footer that this is a "Self-Reported Limit: Non-verifying audit" — worth softening one side or the other so the confidence of the branding matches the actual rigor of a 25-question, unverified self-report quiz.

To reach 10/10: tie the "Leadership Dashboard" link to the specific company/submission ID that was just created (falling back to an explicitly labeled "Sample Workspace" only when no real company exists yet), and dial the report's visual branding down a notch to match its own stated self-reported, non-verifying nature.

Reproduction Steps for the Critical Bug (Report Page Crash)

1. Go to prism-score.vercel.app and click "Start Free Assessment."
2. Fill in any company name, your name, and a work email on the onboarding form; skip adding executives ("Add later").
3. Click "Proceed to Company Assessment (25 Qs)."
4. Click the "Sample Data" button to auto-answer all 25 questions.
5. Click "Submit & Calculate Score" on question 25.
6. Observe: the page goes blank and shows "Application error: a client-side exception has occurred." Console shows TypeError: Cannot convert undefined or null to object at Object.entries, in the report/company/[submissionId] page bundle.
7. Reload the same URL (report/company/<submissionId>) — the report now renders correctly with accurate data, confirming this is a client-side transition/race condition, not a data-integrity issue.

Priority Fix List

Ranked by severity and ease of fix. P0 items block real usage today; P3 items are polish.

Priority	Finding	Recommended Fix
P0	Report page crashes on the submit → report transition.	Guard against an undefined payload during the client-side transition, or force a full navigation after submit.
P0	The $149 paywall is not enforced server-side.	Gate Strengths, Critical Gaps, Action Plan, and the full Audit Log in the API response until payment is confirmed.
P1	Composite score has a rounding bug vs. the published formula.	Compute the composite from raw fractional values; round only at display time.
P1	The one auto-generated recommendation targets the strongest dimension, not the weakest.	Bias the recommendation engine toward the lowest-scoring non-critical dimensions; add a "moderate gap" tier (41–69%).
P2	Audit-log question numbering/order does not match the live assessment.	Preserve the original question order and IDs end to end, from assessment through report.
P2	Jargon in top-tier answers; dimension weights unexplained.	Rewrite jargon-heavy options in plain language; publish a short rationale for each weight.
P3	Default question timer; Leadership Dashboard shows demo data instead of the real submission.	Default to Untimed or a generous 60s; tie the dashboard link to the specific submission ID.

Appendix: Full 25-Question Set by Dimension

Reproduced here for reference so the questions can be reviewed without re-running the live assessment.

Strategy and Leadership (25% weight)

- How is AI currently prioritized on your company executive agenda?
- How aligned is your executive leadership team on where AI should be applied?
- What is your company investment posture regarding AI tooling and adoption over the next 12 months?
- How does your company monitor competitive threats and industry AI innovations?
- What level of clear accountability exists for AI outcomes within the management team?

Use and Value (20% weight)

- Where are AI tools currently deployed in day-to-day operations?
- How does your company measure and track the business value generated from AI tools?
- What is the maturity ratio of your AI projects between isolated pilots and live production use?
- How are client or customer-facing touchpoints enhanced with AI?
- How quickly does your organization adapt AI tools when new capabilities emerge?

Data and Technology (20% weight)

- How accessible, structured, and organized is your internal company data for AI systems?
- What tooling architecture is provided to staff for using AI capabilities?
- How is unsanctioned "Shadow AI" (employees pasting company data into unapproved tools) managed?
- How are your core software platforms (CRM, ERP, ticketing, code) integrated with AI APIs?
- What technical standards govern model evaluations and vendor software vetting?

Governance and Risk (20% weight)

- Does your company maintain a written AI Acceptable Use Policy?
- How does your company protect confidential customer data and trade secrets from LLM training?
- What review protocol exists before AI-generated content or code is published or shipped?
- How are intellectual property and copyright risks handled for AI outputs?
- What incident response plan is established if an AI tool makes an erroneous or biased decision?

People and Skills (15% weight)

- What structured AI education and training is provided to employees?
- What is the general level of prompt engineering and model interaction proficiency across staff?
- How widespread is active, productive AI adoption across non-technical departments?
- How does company leadership address employee anxiety regarding AI job displacement?
- How are internal AI successes and best-practice workflows shared across teams?
